

Zigflow CLI Cheatsheet

90% Daily Usage (Muscle Memory)

```
# Zigflow
zigflow validate workflow.yaml
zigflow run -f workflow.yaml

# Temporal
temporal workflow start --type <wf> --task-queue <q> --workflow-id id --
input '{}'
temporal workflow signal --workflow-id id --name approve --input '{}'
temporal workflow show --workflow-id id
```

Zigflow YAML → Temporal CLI Mapping

Zigflow YAML	Temporal CLI flag
workflowType	--type
taskQueue	--task-queue
listen.to.one.with.id	signal --name
input (workflow start)	--input

Ready Patterns

```
# Parallel — all branches run, output = array
fork:
  compete: false

# Race — first branch wins
fork:
  compete: true

# Wait for human approval
listen:
  to:
    one:
      with:
        id: approve
        type: signal
```

Core Commands

```
# Validate YAML against DSL schema
zigflow validate workflow.yaml

# Start a workflow worker (polls Temporal)
zigflow run -f workflow.yaml

# Run from a directory (all YAML files)
zigflow run -f ./workflows/

# Print DSL JSON schema
zigflow schema

# Generate visual graph of a workflow
zigflow graph -f workflow.yaml

# Show Zigflow version
zigflow version
```

Run Flags

```
# Debug logging
zigflow run -f workflow.yaml --log-level debug

# Info logging (default)
zigflow run -f workflow.yaml --log-level info

# Skip YAML validation on startup
zigflow run -f workflow.yaml --validate=false

# Custom Temporal server address
zigflow run -f workflow.yaml --temporal-address localhost:7233

# Custom Temporal namespace
zigflow run -f workflow.yaml --temporal-namespace my-namespace

# Combined
zigflow run -f workflow.yaml \
  --log-level debug \
  --temporal-address localhost:7233 \
  --temporal-namespace default
```

Validate Flags

```
# Validate and print errors
zigflow validate workflow.yaml

# Validate all files in a directory
zigflow validate ./workflows/
```

Standard Dev Flow

```
# Step 1 - validate
zigflow validate workflow.yaml

# Step 2 - start worker (keep running in this terminal)
zigflow run -f workflow.yaml

# Step 3 - trigger in another terminal
temporal workflow start \
  --type <workflowType> \
  --task-queue <taskQueue> \
  --workflow-id my-run-01 \
  --input '{} '

# Step 4 - send signal if workflow uses listen
temporal workflow signal \
  --workflow-id my-run-01 \
  --name approve \
  --input '{"approved": true}'

# Step 5 - inspect result
temporal workflow show --workflow-id my-run-01
```

Running the Repo Examples

```
cd Zigflow/Examples

# hello world
zigflow validate hello_world.yaml
zigflow run -f hello_world.yaml
# trigger: temporal workflow start --type hello-world --task-queue zigflow
--workflow-id hw-01 --input '{} '

# HTTP call
zigflow run -f http_call.yaml
# trigger: temporal workflow start --type fetch-user --task-queue zigflow-
http --workflow-id http-01 --input '{} '

# Signal-driven
```

```
zigflow run -f signal_driven_workflow.yaml
# trigger: temporal workflow start --type signal --task-queue zigflow-
signals --workflow-id sig-01 --input '{}'
# signal:  temporal workflow signal --workflow-id sig-01 --name approve --
input '{"approved": true}'

# Parallel/race
zigflow run -f parallel_task.yaml
# trigger: temporal workflow start --type competing-tasks --task-queue
zigflow-parallel-tasks --workflow-id par-01 --input '{}'

# Error handling
zigflow run -f error_handling.yaml
# trigger: temporal workflow start --type try-catch --task-queue zigflow-
error-handle --workflow-id err-01 --input '{}'
```

Debugging Checklist

- | | |
|---|---------------------------------|
| 1. zigflow validate workflow.yaml | → fix schema errors first |
| 2. zigflow run -f workflow.yaml \ | |
| --log-level debug | → verbose activity/task logs |
| 3. temporal workflow list | → find stuck/running workflows |
| 4. temporal workflow describe \ | |
| --workflow-id <id> | → check status, taskQueue, type |
| 5. temporal workflow show \ | |
| --workflow-id <id> --detailed | → inspect full event history |
| 6. Check: taskQueue matches Worker config | |
| 7. Check: workflowType matches Worker config | |
| 8. Check: signal --name matches listen.to.one.with.id in YAML | |

Failure Debugging Flow

```
# Step 1 - schema errors
zigflow validate workflow.yaml

# Step 2 - verbose worker output
zigflow run -f workflow.yaml --log-level debug

# Step 3 - find the workflow
temporal workflow list

# Step 4 - check its metadata
temporal workflow describe --workflow-id <id>

# Step 5 - inspect full event history
temporal workflow show --workflow-id <id> --detailed
```

Common Errors

Symptom	Fix
<code>schema validation failed</code>	Run <code>zigflow validate</code> and fix reported field
Worker starts but workflow never runs	<code>taskQueue</code> or <code>workflowType</code> mismatch
<code>listen</code> never unblocks	Signal <code>--name</code> doesn't match YAML <code>id</code>
<code>NonDeterminismError</code> in logs	<code>set</code> task uses non-deterministic expression
Workflow times out	Increase <code>metadata.activityOptions.startToCloseTimeout</code>
